Research Summary	<p>My current research focuses on post-training techniques (e.g., reinforcement learning) and synthetic data generation to evaluate and equip Large Language Models (LLMs) with reliable and advanced capabilities, such as instruction following [1, 4], reasoning [6], agentic problem solving [2,4,5] and efficient inference [3]. I have experience in adapting LLMs for healthcare applications [7, 8, 9]. <i>I am particularly interested in developing controllable LLMs, such as complex instruction following [1], smart agentic search [4], and instruction hierarchy enforcing.</i></p> <p>Before the era of LLMs, my work primarily focused on improving the dialogue abilities of language models—for example, maintaining self-consistency [10] and safety [11] in conversation, as well as understanding the speaker’s core semantic meaning [12] and emotions [13].</p> <p>Overall, I have published 14 papers in these directions, including 9 first-authored papers and 10 peer-reviewed publications in top-tier AI conferences.</p>
